768Jet™ Printhead

Enhancing Brand Appeal Through Secondary Packaging

With the ability to print quality graphics, scannable bar codes and crisp alphanumeric text directly onto secondary packaging, the Trident 768Jet printhead is a brand enhancing, cost-efficient alternative to labels and pre-printed boxes.

Brand Enhancing Graphics

The Trident 768Jet printhead prints images up to four inches tall, the tallest in the carton coding market. The ability to produce elegant, attention-grabbing graphics directly onto boxes greatly enhances the branding power of secondary packaging. The 768Jet printhead enables users to effectively reflect the high quality of their brand to consumers.

Print Flexibility

The Trident 768Jet ink jet printhead is specially designed for carton labeling, bar coding and graphics imaging. With the ability to print high-quality graphics, scannable bar codes and crisp alphanumeric text with ease, the 768Jet printhead adds flexibility to printing operations.

The 4 inch print height available with the 768Jet printhead, makes it possible to include up to 40 lines of printed information on each container. This feature is ideal for listing ingredients or for highlighting product details in various languages.

The ability to print-on-demand also adds flexibility to factory floors as there is no need to store and transport large quantities of pre-printed boxes.

Durable Design

In order to work efficiently, ink jet printing systems must be ruggedly designed to work alongside the bus-

tle and bustle of employee and machine activity on the factory floor.

With features like a stainless steel orifice plate and patented shock-resistant compliance chambers, the Trident 768Jet printhead is robustly designed to deliver premium performance in even the harshest environments.

The 768Jet also features a repairable design which can lead to long-term printhead replacement savings when compared to non-repairable, disposable printheads.

Automatic Maintenance

The 768Jet features an Automatic Maintenance Module™ (AMM™) that routinely purges foreign objects like factory dust from the printhead to ensure consistent high-quality printing performance. This system re-primers the printhead by flushing out any debris that may clog a printing orifice and reduce print quality.

The 768Jet's automatic maintenance system simultaneously enhances printhead durability and quality and minimizes the need for operator intervention, which in turn minimizes maintenance expenditures.

Industry-leading Warranty

The 768Jet printhead comes with a three year warranty against failure – the longest printhead warranty on the market!
